

OBJECTIVE

Aspiring Software Development and Data Science Engineer with strong skills in Python, SQL, machine learning, data analytics, and visualization. Experienced in developing analytical solutions, predictive models, and data-driven insights through academic and project work. Familiar with Agile methodologies, problem-solving, and collaborative development environments. Seeking an opportunity to contribute to software development, analytics, and process automation.

EDUCATION

B.Tech in Computer and Communication Engineering

CGPA: 6.84

Amrita School of Engineering, Amrita Vishwa Vidyapeetham, Coimbatore

2023 – Expected 2027

High School and Secondary School

HSC: 73.00%, SSLC: 83.00%

Shree Sarasswathi Vidhyaah Mandheer Institutions, Mettupalayam

2019 – 2023

PROJECTS

UIDAI Data Hackathon 2026 – Aadhaar Service Demand Analytics

- Designed a three-layer analytical framework to analyze Aadhaar enrolment, biometric updates, and demographic corrections.
- Identified age-wise and state-wise enrolment delays and high-maintenance regions using operational data analysis.
- Converted analytical findings into actionable insights for lifecycle-based service planning and capacity optimization.

RetailPulse 360 – Retail Business Intelligence & Decision Analytics Platform | [GitHub](#) | [Live Dashboard](#)

- While researching retail operations, I discovered the industry loses \$1.75 trillion annually due to siloed data and inventory distortion — validated by IHL Group's 18-year global retail research (2024) — and engineered an end-to-end Power BI solution to solve it.
- Designed a Star Schema data warehouse in PostgreSQL (646,000+ records), built a complete ETL pipeline in Power Query, and authored advanced DAX measures including time intelligence (MTD/QTd/YTD), RFM segmentation, and 90-day demand forecasting.
- Delivered 7 role-based dashboards with Row-Level Security for 6 personas, Optimized dashboard, AI-powered forecast, performance optimization, and daily scheduled refresh deployed on Power BI Service via On-premises Gateway.

Exoplanet Detection Using Deep Learning

- Analyzed NASA Kepler and TESS light curve datasets to identify planetary transit patterns using deep learning techniques.
- Developed and trained a Convolutional Neural Network (CNN) model to classify exoplanet and non-exoplanet signals from time-series light curve data.
- Implemented preprocessing, normalization, and stellar noise reduction techniques to improve signal quality and model accuracy.
- Evaluated model performance using Accuracy, Precision, Recall, and AUC-ROC metrics for predictive analytics validation.

Skills & Abilities

- **Programming Languages:** Python, SQL, NO SQL
- **Data Science & Machine Learning:** Machine Learning, Deep Learning, Predictive Analytics, Neural Networks, Pandas, NumPy, Scikit-learn, RFM Segmentation,
- **Big Data & Analytics Tools:** PySpark, Hadoop, Hive, Data Modeling, Data Cleaning
- **Business Intelligence & Visualization:** Power BI Desktop & Service, Power Query , DAX, Dashboards ,Data Visualization, Data Storytelling ,ETL Pipeline ,Row-Level Security ,scheduled Refresh
- **Database Technologies:** MySQL, PostgreSQL, MangoDB ,SQL Queries ,NO SQL ,Window Functions ,Data Warehouse Design ,
- **Excel Analytics:** Pivot Tables, Pivot Charts, VLOOKUP, XLOOKUP, INDEX-MATCH, IF, COUNTIF, Conditional Formatting

- **Computer Science Fundamentals:** Data Structures & Algorithms, Fundamentals of cloud computing, Object-Oriented Programming (OOP), Operating Systems Fundamentals
- **Software Development Practices:** Agile Methodologies, Scrum, Documentation, Problem Solving, Team Collaboration
- **Other Interests:** Algorithmic Trading, Stock Market Analysis, Sports Leadership
